CHAPTER 0

Economics Refresher	17
----------------------------	----

1. Introduction	17
2. The market	18
2.1 Individual demand	18
2.2 Aggregate demand	19
2.3 Optimal allocation of demand	20
2.4 Individual supply function	20
2.5 Aggregate supply	21
2.6 Optimal allocation of supply	21
2.7 Competitive market equilibrium	22
3. Linear demand functions	24
4. Market power	26
4.1 Monopoly	26
4.2 Imperfect competition	28
5. Who bears the costs of taxation?	30
6. Public goods	31
7. External effects	32
8. Conclusion	33
9. Exercises	34
10. References	34

CHAPTER 1

History and future of energy use	35
---	----

1. Introduction	35
2. Drivers of energy use and energy prices	35
2.1 Energy use in the production sector	36
2.2 Energy use by final consumers	39

2.3	Main drivers of energy use	42
3.	Energy in historical perspective	43
3.1	Income and population growth	44
3.2	Energy use for household heating	45
3.3	Energy use for power	47
3.4	Price of lighting services	48
3.5	What happened to energy prices and the price of energy services over the last 700 years?	48
3.6	Energy consumption	49
4.	Future trends	49
5.	Understanding world energy markets	52
5.1	Aggregate energy demand by type of energy	52
5.2	Aggregate energy supply by type of energy	54
5.3	Equilibrium on the energy markets	54
5.4	Why is making scenarios for the future difficult?	55
6.	Conclusion	55
7.	Exercises	56
8.	References	56

CHAPTER 2

Economics of non-renewable resources	59	
1.	Introduction	59
2.	Classifying resources	60
3.	Optimal allocation of a non-renewable resource over time – the N period case	61
3.1	Basic N -period model	62
3.2	Basic N -period model with backstop	64
3.3	Increasing marginal cost of extraction	65
3.4	Reserve dependent costs	66
3.5	Comparative statics of the continuous extraction problem	66
3.6	Higher discount rate	69
3.7	An increase in the size of the resource stock	69
3.8	Effect of a higher marginal extraction cost	70
3.9	Increase in the expected demand	70
3.10	A fall in the cost of the backstop technology	71
3.11	Interpretation of the comparative statics exercise	72
4.	The allocation of non renewable resources in a market economy	73
4.1	Perfect competition case	73
4.2	Monopoly case	74
4.3	Some more issues that arise in a market context	76

5.	Extension of the theory to recyclable exhaustible resources	77
6.	How does the model perform in reality?	79
7.	Conclusion	80
8.	Exercises	81
9.	References	81

CHAPTER 3

Environment	83	
1.	Introduction	83
2.	Basic environmental economics	83
2.1	Problem setting	83
2.2	Ideal (or theoretically optimal) solution	86
2.3	Non-cooperative solution	90
2.4	Centralized government solution	91
3.	The effect of different environmental policy instruments on market prices and profits	94
3.1	An analytical illustration for the car market	95
3.2	Effects of different instruments on profits	100
4.	Conclusion	102
5.	Exercises	102
6.	References	103

CHAPTER 4

The energy saving gap	105	
1.	Introduction	105
2.	An investment model	106
3.	Empirical evidence on the investment inefficiency	108
3.1	Engineering estimates of energy saving cost curves	109
3.2	Empirical estimates of returns on investment	109
3.3	Cost-effectiveness of energy conservation programs	110
3.4	Trade-offs between durable goods	110
3.5	Possible explanations of the energy efficiency gap	111
4.	Policy implications	111
5.	Conclusion	112
6.	Exercises	112
7.	References	112

CHAPTER 5

Sustainability 115

1. Introduction 115
2. Sustainability as a maximum of discounted utility 115
3. Sustainability as guarantee for utility of future generations 118
4. Conclusion 121
5. References 121

CHAPTER 6

Economics of Climate Change 123

1. Introduction 123
2. Climate change is a worldwide issue 123
 - 2.1 Emissions and climate 123
 - 2.2 The origin of GHG emissions 128
 - 2.3 The stock dimension of GHG emissions 129
3. How to select a climate change strategy in an ideal world? 130
 - 3.1 A broader perspective 130
 - 3.2 What objective function to select an optimal level of reduction? 131
 - 3.3 Integrated assessment models to compute an optimal policy 133
 - 3.4 Damage of climate change 135
 - 3.5 Costs of emission abatement 137
 - 3.6 What strategy for emission reduction? 139
4. Economics of international climate agreements 140
 - 4.1 The one shot game 142
 - 4.2 The repeated game 145
 - 4.3 A catastrophic climate game 145
 - 4.4 A way out according to economists: climate clubs 146
5. Conclusion 149
6. Exercises 149
7. References 149

CHAPTER 7

European climate change policy 151

1. Introduction 151
2. EU Climate change policy 151
 - 2.1 International negotiation strategy of the EU 151

2.2	European climate policy	153
3.	A closer look at the experience with the ETS in the EU	154
3.1	The organization of the ETS system	154
3.2	Price formation of CO ₂ permits	155
4.	A critical assessment of the European climate policy	160
4.1	The extent of the European effort	160
4.2	The effects on the international energy markets: can a unilateral effort be effective?	161
4.3	Choice of policy instruments	163
5.	Which way forward?	163
5.1	Credibility issues	164
5.2	A worldwide perspective on cost efficiency	165
5.3	Technology policies	165
5.4	Distinguishing between high rent and low rent fossil fuels	170
6.	Conclusion	170
7.	Exercises	170
8.	References	171

CHAPTER 8

Coal		173
1.	Introduction	173
2.	Some conventions and definitions	173
2.1	Different types of coal	173
2.2	Units	174
2.3	Sources of data and forecasts	174
3.	Main uses, consumers, producers and trade flows	174
3.1	Main uses	174
3.2	Main producers and consumers	177
3.3	Trade flows	177
4.	How much coal is there?	177
4.1	Proven reserves	177
4.2	Resources	178
5.	Economics of the coal market	181
5.1	Opening the coal sector to foreign trade	181
5.2	Theory of comparative advantage	181
5.3	Opening a sector to trade	182
5.4	Coal has high transport costs	184
6.	Coal market operations	185
7.	Modelling the world coal market	187

7.1	Perfect competition model	187
7.2	Non-competitive models	188
8.	History of the coal market in Western Europe	188
8.1	Second World War – 1970	188
8.2	From 1974-2004	189
8.3	From 2004 onwards	190
9.	Conclusion	191
10.	Exercises	192
11.	References	192

CHAPTER 9

Oil		195
1.	Introduction	195
2.	Some conventions and definitions	195
2.1	The different types of oil	195
2.2	Units	197
2.3	Sources of data and forecasts	197
3.	Main uses, consumers, producers and trade flows	197
3.1	Main uses	197
3.2	Consumption and main producers	203
3.3	Trade flows	204
4.	How much oil is there?	205
4.1	Proven reserves	205
4.2	Resources	206
5.	Trading in the oil market	208
6.	Two simple models for the world oil market	209
6.1	A simple oil market model with short and long run equilibria	211
6.2	An imperfect competition model for the oil market	214
7.	Understanding the history of the world oil market	219
7.1	Before 1970	219
7.2	After 1970	221
7.3	And the future?	226
8.	Policies to stabilise or decrease oil prices	226
8.1	Emergency and strategic stockpiles	226
8.2	Import taxes	227
8.3	Decreasing the oil dependency of the economy	227
8.4	Climate change policy and the world oil market	227
9.	Price formation of oil products	228
10.	Conclusion	230

11. Exercises	230
12. References	233

CHAPTER 10

Gas	235
1. Introduction	235
2. Some conventions and definitions	235
2.1 Different types of gas	235
2.2 Units	236
2.3 Sources of data and forecasts	236
3. Main uses, consumers, producers and trade flows	236
3.1 Main uses	236
3.2 Main producers	238
3.3 Trade flows	239
4. How much gas is there?	242
4.1 Proven reserves	242
4.2 Resources	244
5. Economics of the gas market	245
5.1 High transport costs	245
5.2 The hold-up problem for specific transport infrastructure	246
5.3 Price discrimination	247
5.4 Netback pricing of natural gas and take or pay contracts	247
5.5 A Cournot equilibrium	248
6. History of the gas market in Western Europe	249
6.1 Before 1973	249
6.2 From 1974-2004	250
6.3 Since 2004	252
7. Modelling the European gas market	253
7.1 Structure of the model	253
7.2 Downstream: behavior of traders	254
7.3 Upstream: behavior of producers	256
7.4 Empirical specification	258
8. The security of European gas supply	262
8.1 Introduction	262
8.2 Transporting Russian gas to Europe	263
8.3 How to deal with unreliable Russian gas supply?	264
8.4 Will the development of shale gas contribute to the security of gas supply in Europe?	268
9. Conclusion	269

10. Exercises	270
11. References	271

CHAPTER 11

Structure of Electricity markets	273
1. Introduction	273
2. Some conventions and definitions	274
3. Main uses, consumers, producers and trade flows	274
3.1 Main uses	274
3.2 Electricity consumption	275
3.3 Electricity generation by fuel	275
3.4 Trade flows	276
4. Electricity liberalization	276
4.1 Structure of the electricity network	276
4.2 Electricity liberalization	277
5. Electricity market design	281
5.1 Level 1: Degree of liberalization	281
5.2 Level 2: The existence of different markets	283
5.3 Level 3: The design of individual markets	287
6. Electricity market design in the European Union	287
6.1 The energy law-making process in the European Union	287
6.2 The European Target Electricity Model	288
6.3 Current state of the European Target Electricity Model	291
7. Electricity market design in the United States	292
7.1 Liberalized and integrated regions	292
7.2 Different operating models	293
8. Conclusion	294

CHAPTER 0

ECONOMICS REFRESHER

1. Introduction

'Economics' studies how scarce resources can best be used to satisfy different and ample needs. As on the one hand resources are limited, but on the other hand the needs of economic agents are superfluous, choices have to be made. This dilemma of choice in economics can be captured in 4 basic questions:

- What can be produced and in what quantity?
- How are goods and services produced?
- Who are the goods and services produced for?
- Who takes the economic decisions, and what process leads to these decisions?

The answers to these questions are largely given by the process of a market economy. In the next section we discuss the building blocks of this market economy, more specifically for the electricity market.

The objective of this chapter is to elaborate on the basic concepts that are used in the rest of the book to discuss the energy market. The basic principles of the functioning of a market are explained by using a 'partial equilibrium analysis' (i.e., study one market and keep all the others constant). By the end of this chapter, the reader should be able to understand and use the following important concepts:

- Individual demand, aggregate demand, willingness to pay (WTP)
- Supply of one firm, aggregate supply in industry
- Efficient allocation of a quantity over a set of consumers
- Efficient production of a quantity by a set of producers
- Producer and consumer surplus
- Perfect competition market equilibrium
- Imperfect competition
- External effects
- Public goods

2. The market

Private decisions are at the basis of the functioning of the market. These decisions follow from the belief that they will lead to an advantage for the decision-maker. If someone buys a can of cola, this only happens because that person believes the cola is worth its price. The seller of the cola only sells the can because he knows that it will result in some kind of profit for him. Since the transactions take place on a voluntary basis, all parties involved will find their advantage (or at least no disadvantage) in the deals. It is this search for interesting transactions that leads to an equilibrium in the market. In this equilibrium an *equilibrium price* occurs, which is the price where demand for a certain good or service equals the supply for that good or service.

2.1 Individual demand

The quantity of electricity that a consumer wishes to use depends on many factors, such as the price of electricity, the price of other energy sources (gas, coal...), the consumer's preferences, his budget, the season, the moment of the day... Bringing all these factors into our analysis would result in a very complex case. So in a first step, only the relation between the price of electricity and the quantity demanded is considered, while the value of all other factors is assumed to be a given. A possible graphical representation of this relationship, the demand function, is shown in Figure 0.1. Throughout the course, we will occasionally use linear demand functions. In section 3 we illustrate where these linear demand functions originate from.

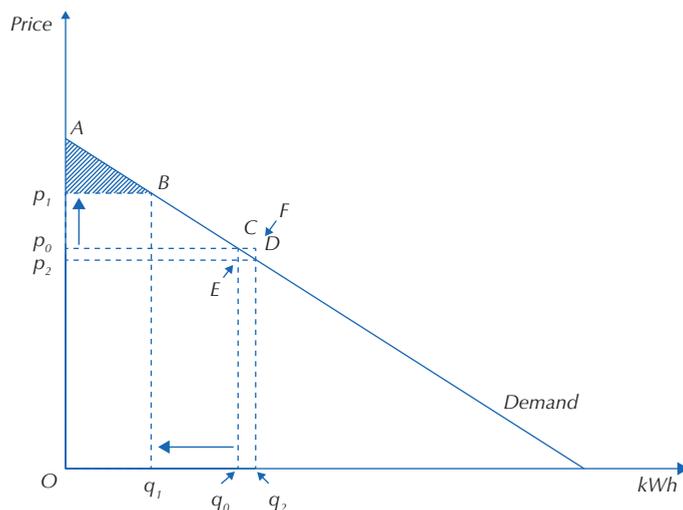

FIGURE 0.1. Individual demand.

The demand function is expressed as $D(q)$, with $D'(q) < 0$. In general the relation between the quantity demanded and the price is negative. If the price of 1 kWh of electricity is p_1 then demand will be q_1 kWh. If the price would decrease to p_0 , demand will increase to q_0 kWh. In the same sense, the demand curve also gives us the maximum price the consumer wants to pay for a certain unit of electricity (in kWh). This price is an indication of the value the consumer attaches to this kWh, and is therefore also called the 'willingness to pay' (WTP). So for the q_0^{th} kWh, the consumer is willing to pay a price p_0 .

The benefits the consumer receives from buying electricity are shown in Figure 0.1 as well. If the market price for a kWh is p_1 , a quantity of q_1 is consumed. We can see that the consumer is willing to pay more than p_1 for each of these kWh (except for the last unit, for which the consumer wants to pay exactly p_1). The value attributed by the consumer to these quantities is higher, so the consumer retrieves a surplus from this transaction, the **consumer surplus**. For the first kWh the advantage equals $A - p_1$. This advantage can be calculated similarly for all the units, so that the total consumer advantage of consuming q_1 at a price p_1 sums up to the surface of the triangle p_1AB .

2.2 Aggregate demand

Market demand for electricity results from summing the demand for electricity over all consumers, for each price level. This is shown in Figure 0.2. Demand from consumer a and demand from consumer b (horizontally) sums up to demand $a + b$.

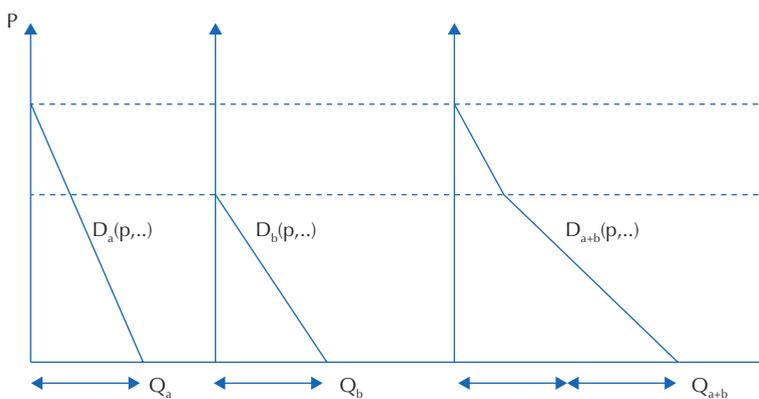

FIGURE 0.2. Aggregate demand.

2.3 Optimal allocation of demand

From a demand side point of view, the optimal allocation of a good is such that the marginal willingness to pay is equal for all consumers. If a total quantity Z is offered, then the allocation of Z among consumer a and b is such that the total ‘value’ for consumers is maximized, which is shown in Figure 0.3. In this way, those who need it most also get it, or those who would be prepared to pay the highest price get it.

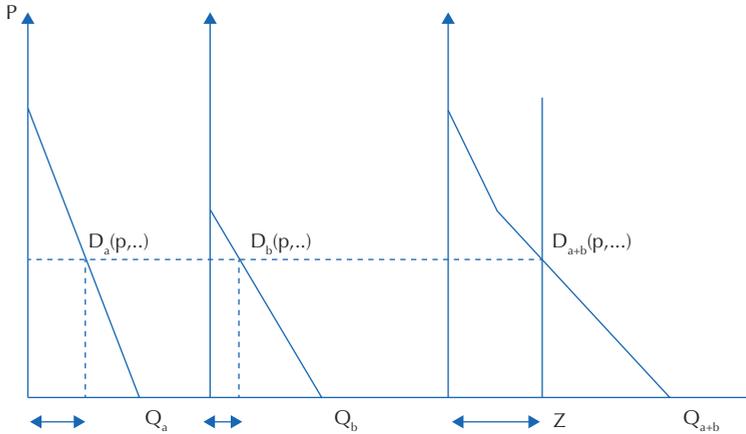

FIGURE 0.3. Optimal allocation among consumers.

2.4 Individual supply function

The second party involved in a market transaction is the seller or the supplier of a good or service. Again, supply of electricity is defined by many different factors, such as the price of primary energy sources (coal, oil, gas, nuclear), available technologies etc. And again it is standard practice to focus on the relation between the price of the good or service and the quantity that is offered on the market at that price, keeping all other factors constant.

In the typical case there is a positive relation between the price and the quantity offered. Figure 0.4 illustrates such a relation for the supply of electricity. For example, at a price of p_0 a quantity of q_0 is supplied, while at a higher price p_1 supply also increases, to q_1 . We can also read on the graph at which minimum price a producer is willing to supply a certain quantity on the market. This price should be high enough to cover the additional costs of producing this additional unit or *kWh*. This cost is also called the *marginal cost* of production. When a supplier or producer receives a
